

Interpreted Pattern Match Execution

Agenda

- ▷ Background and motivation
- ▷ Turning patterns into bytecode
- ▷ Dialect for patterns
- ▷ Optimizing patterns
- ▷ Dialect for a state machine
- ▷ Quick look at the interpreter
- ▷ Performance metrics
- ▷ Current status and what's next

Background

Match and Rewrite

- ▷ Underlies many MLIR code transformations
- ▷ Not runtime extensible
- ▷ Has room for match optimization
- ▷ Binary size bloat

Comparison to LLVM

SelectionDagISel

- ▷ Contract nodes
- ▷ Factor nodes
- ▷ `vector<vector<...>>`

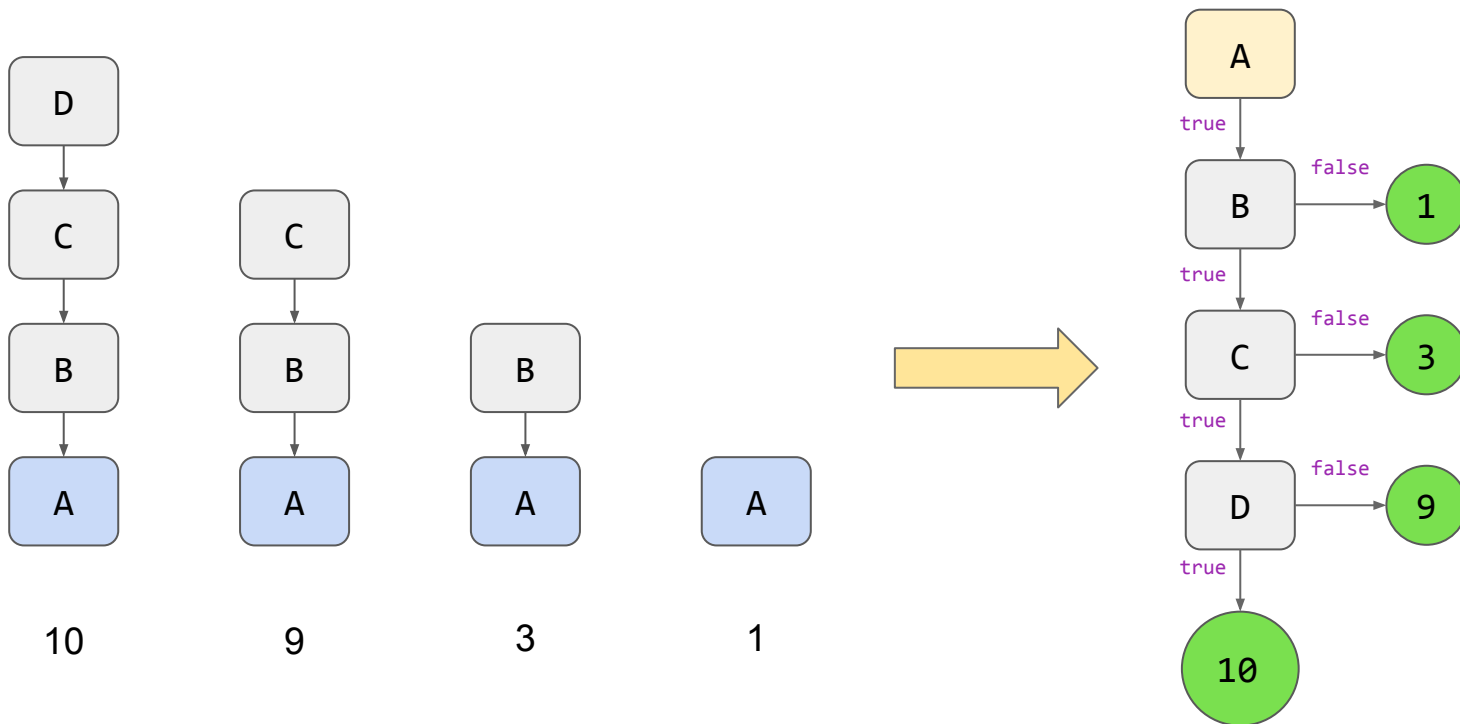

GlobalISel

- ▷ Direct improvement over `SelectionDagISel`
- ▷ Plus some small optimizations
- ▷ Uses a single `vector<...>`

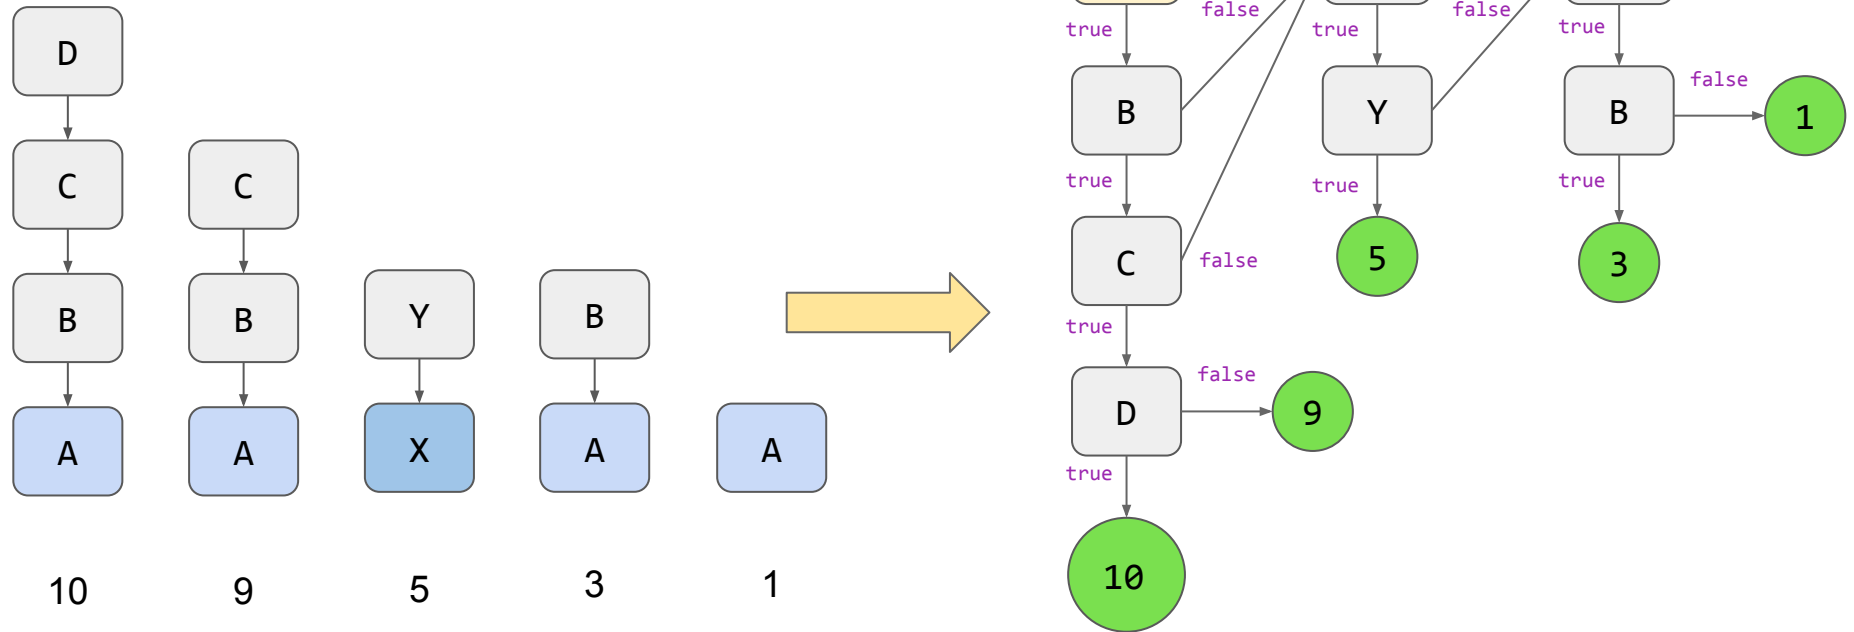

MLIR

- ▷ More optimal merge/factor of nodes
- ▷ A few rewrite patterns on FSM
- ▷ Preallocated `vector<...>`

Merge Barriers

Merge Barriers

Metrics

Estimates*

- ▷ Bytecode is ~10x smaller than pattern object file
- ▷ Pattern merge time is ~15x faster than compiling in Clang

Pattern Match Runtime

Pattern Match Runtime

- ▷ Seems to remove number of patterns from runtime complexity
- ▷ Interpreter adds ~15 ms of overhead

Current Status

- ▷ Not upstream
- ▷ No support for ODS variadic arguments as in TableGen
- ▷ Otherwise feature-complete
- ▷ Hybrid pattern generator from TableGen

Next Steps

- ▷ Not upstream
- ▷ No support for ODS variadic arguments as in TableGen
- ▷ Otherwise feature-complete
- ▷ Hybrid pattern generator from TableGen
